

REMARKS

Claims 32-63 presently appear in this case. No claims have been allowed. Claims 10-13 and 16-31 have been withdrawn from consideration. The official action of January 7, 2003, has now been carefully studied. Reconsideration and allowance are hereby respectfully urged.

Briefly, the present invention relates to technology developed in the laboratory of the present inventors, which is now known in the art as autoimmune neuroprotection. It has been discovered that neuronal degeneration caused by the neurodegenerative effects of disease or secondary neuronal degeneration that follows the primary neuronal damage of an injury can be reduced if steps are taken to cause T cells activated against an NS-specific antigen which, in its native state, is present at the site of neuronal degeneration, to accumulate at the site of neuronal degeneration. The mere presence of these activated T cells at the site of injury causes a cytokine response that has a significant effect in reducing the neuronal degeneration. The present invention is directed to the improvement in which the T cells are activated by poly-Glu,Tyr (pEY). The preferred methods of causing the T cells to accumulate at the site of injury is to either administer T cells activated against pEY, or to administer the

pEY itself in such a way as to cause a T cell response such that T cells become activated against pEY.

The interview among examiners, Nichols and Kemmerer, the inventor, Prof. Michal Schwartz, and the undersigned attorney, which interview was also attended by examiners Turner, Bunner, and Kunz, on June 26, 2003, is hereby gratefully acknowledged. In this interview, Prof. Schwartz presented a slide presentation explaining the work of her laboratory that resulted in the present invention and the subsequent work which has been done in proving broad applicability of the present invention. This work has been published in prestigious journals, copies of which are being made of record herewith. Claim wording that might appropriately claim the full breadth of this invention without reading on the prior art and in full compliance with 35 USC 112 was discussed at the interview. While no agreements were reached, it is believed that the examiners now have a better understanding of the present invention, and that in additional discussions, the examiners can help applicants in appropriate wording of the claims in order to obtain appropriate protection for this important and novel advance in the art.

All of the claims in this application have now been deleted in favor of new claims 32-63. The new claims submitted herewith attempt to adopt the language that was

discussed at the interview. If this language is not considered to put this case into condition for allowance, it is respectfully requested that the examiner contact the undersigned to schedule a further interview to discuss language for this case that might be acceptable.

Support for the language of new claims 32 and 48 may be found in the specification. For example, the paragraph at page 8, lines 15-20, discloses that the invention may be used to inhibit the degenerative effects of disease in the NS, including the inhibition of secondary degeneration that may otherwise follow primary NS injury. With respect to claim 48, note page 8, lines 7-14, which states that the present invention relates to methods to "ameliorate the effects of injury or disease of the nervous system".

The examiner has deemed the previous restriction requirement to be proper and has made it final.

Claims 16-31, drawn to pharmaceutical compositions have now been deleted without prejudice toward the continuation of prosecution thereof in a divisional application. With respect to previously appearing claims 10-13, however, it is urged that new claims 32 and 48 are linking claims that appropriately claim the full breadth of the method of the present invention. The main step of both claims is causing T cells activated by pEY to accumulate at the site of

neuronal degeneration in the individual in need, thereby reducing neuronal degeneration at that site, or ameliorating the effects of the injury or disease at that site. This is generic to preferred methods of active and passive administration of such T cells as claimed in claims 42, 44, 58 and 60. Furthermore, as was explained in the interview, the effect of the invention is the same whether treating secondary degeneration caused by an injury or the degeneration caused by a disease. Accordingly, it is again respectfully requested that the restriction requirement be reconsidered and withdrawn in view of the presence of the linking claims submitted hereby.

The examiner has objected to the specification because of informalities at pages 18, 19 and 37.

The specification has now been amended in order to eliminate the informalities noted by the examiner.

The examiner has objected to the drawings because the Y-axis on Fig. 1 is not legible, nor is the X or Y-axis on Fig. 3. The examiner has required a proposed drawing correction or corrected drawings to avoid abandonment of the application as the objection to the drawings will not be held in abeyance.

Attached hereto are corrected Figs. 1-4, which not only correct the errors noted by the examiner, but also

eliminate the titles and captions which are inappropriate to have in drawings. It is believed that the attached drawings should be acceptable formal drawings which eliminate the objections noted by the examiner.

Claims 1-9 and 14-15 have been objected to as referring to non-elected material and referring to non-elected species. Further, claim 14 has been objected to as not ending with a period.

Claims 1-9, 14 and 15 have now been deleted in favor of the present new claims. In view of the linking claims presented herein, reconsideration and withdrawal of the restriction requirement has been requested. As it is believed that generic claims are now allowable, all species should be examined. In any event, non-elected material may remain in the claims pending any petition that applicant may wish to file under 37 CFR 1.144 and reference to non-elected species should be allowed to remain in the claims until the allowability of generic claims is determined. Reconsideration and withdrawal of this requirement is therefore respectfully urged.

Claims 1-9, 14 and 15 have been rejected under 35 USC 112, first paragraph, because the specification, while being enabling for a method of lessening retinal ganglion cell (RGC) death via prophylactic administration of pEY, does not

reasonably provide enablement for preventing or inhibiting neuronal degeneration, promoting nerve regeneration or protecting CNS or PNS cells from glutamate toxicity. The examiner states that the specification does not enable persons of ordinary skill in the art to make or use the invention commensurate in scope with these claims. This rejection is respectfully traversed.

Prof. Schwartz made a comprehensive presentation at the interview explaining the many successful experiments which have been undertaken in her laboratory to show the broad applicability of the technology involved with the present invention. While much of the background and most of the experiments dealt with T cells activated against NS-antigens or against COP 1, that which is now known about this technology allows one of ordinary skill in the art to understand that the predictions made in the present specification would be expected to be accurate. The experiments herein show that pEY behaves similarly to COP 1, and so it would be expected that the experiments which have been established for pEY in the present specification could be extended to the reduction of neuronal degeneration caused by the degenerative effects of any disease or for reducing secondary neuronal degeneration that follows the primary neuronal damage of any injury.

The basic paper is Moalem et al, Nature (1999).

Halben, J. Neurosci. (2000) expands the original work in the optic nerve to spinal cord contusion, including both active and passive administration. This proves the concept that the same active T cells work in radically different sites. Fisher et al, J. Neurosci. (2001), disclose active and passive vaccination to raise T cells specific to various NS-specific proteins. Butovsky et al, FASEB J (2001), show a proof of mechanism establishing that T cells get to the site of the lesion in the spinal cord. Schori et al, PNAS (2001), is an important paper relating to glutamate and glaucoma, establishing that COP 1 works where there is no myelin and MBP does not work. Yoles et al, J. Neurosci. (2001), shows the

beneficial aspect of passive transfer of T cells. Hauben et al, J.C.I. (2001), disclose experiments that altered peptides work in order to obtain the benefit of neuroprotection. It should be understood that this paper won an award as one of the ten leading papers of the year for this journal. Hauben et al, PNAS (2001), shows active and passive vaccination with Nogo A. Misrachi et al, J. Immunol. (2002), is important in showing that the specificity of the antigen for beneficial autoimmunity is determined by the site and not by the type of insult. Angelov et al, PNAS (2003), shows the operability of the present invention in the PNS.

It is urged that these papers establish for the record what Prof. Schwartz was able to explain at the interview. In light of all the experiments that have been done with respect to the technology of this invention, the full scope of the present invention would be expected to be operable. There is no reason to believe that undue experimentation would be involved in order to make and use the full scope of the present invention. Reconsideration and withdrawal of this rejection are therefore respectfully urged.

The art made of record by the examiner has been noted, as has the examiner's implicit recognition that none are sufficiently pertinent to warrant their application against the claims.

In re of Appln. No. 09/893,344

It is submitted that all of the claims now present in the case clearly define over the references of record, and fully comply with 35 USC 112. Reconsideration and allowance are therefore earnestly solicited.

Respectfully submitted,

BROWDY AND NEIMARK, P.L.L.C.
